The focus of this course is on understanding the relationship between brain and behavior. The human brain’s major naturally-selected function is to generate adaptive behavior under a variety of conditions, including with reference to prior experience. In this course we will discuss how the brain mediates major behavioral functions, how these go awry in psychiatric disorders, as well as major methodological approaches used in behavioral neuroscience research. The format of the course is a mixture of presentations led by the instructor and seminar style discussions incorporating assigned readings. There is a strong emphasis on class discussion and participation, with students expected to have read, thought about, and discuss primary-source papers.

Lecture times:  MWF 9-10:20AM; McGaugh Hall 2246

Web site: The class web site [https://canvas.eee.uci.edu/courses/16127](https://canvas.eee.uci.edu/courses/16127) will include up-to-date information on the lecture schedule and assigned readings. Lecture slides will also be posted.

Add & Drop Policy: Adds and drops are handled exclusively through WebReg. The add/drop deadline is April 13, 2018 and students are responsible for all materials from the start of the term. Failure to take any exams or quizzes, even those given before you have added the course, will result in a zero score for each quiz or exam.

Instructors:
Stephen Mahler (coordinator): mahlers@uci.edu
Norbert Fortin: norbert.fortin@uci.edu
Christie Fowler: cdfowler@uci.edu

Grading: There will be three midterm exams and each will account for 20% of your total grade. 15% will be based on an end-of-term project proposal, 5% on your participation in the “Neuroscience Controversies” session, and 20% on class participation.

Neuroscience Controversies:
Near the end of the quarter, we will engage in an active learning session where you will construct a debate-style argument in favor of an assigned position in a current neuroscience controversy. You will work in a group of 2-3, and will be assigned a position to defend in the debate. Each group member will speak in the debate, presenting an informal opening statement, rebuttal, or closing statement. We expect this format will help develop critical thinking and group operation skills.

Final Presentation:
Presentations will occur on the last 3 days of class. You will do a "data blitz" style presentation (maximum 15 min, preferably 10) on a research question of your choice stemming from presentations/discussions we’ve had in class.

Guidelines:
15m total time per student, so aim for a maximum of 10min to make sure there is plenty of time for questions (and there will be questions!). You will be cut off at 15min exactly (not counting any questions asked during the presentation), so be careful. Shorter is not equal to worse! We don't need all the details or nuance, the goal here is to convey the major points in an efficient and punchy manner.
Your assignment is to design an experiment or set of experiments to address any of the topics raised during class (but not something that you have done as a project in a rotation lab). KEEP IT SIMPLE! Pretend you’re pitching the idea to a grant agency / donor on a 10min elevator ride (a skyscraper I guess?). This is not supposed to be a full grant, just an experiment that tests a single, currently unknown concept or question.

The experiment should be viable, but don’t worry about actual costs, and assume a lenient (but realistic) IRB/IACUC. In other words: "Effects of space travel on working memory=OK. Effects of time travel on working memory=not OK." (but make sure there is a reason to think, e.g., space travel might affect memory, since gravity is known to affect pyramidal cell function).

Pick a topic, focus in on a concrete question, and design the experiment. Clarity in your thinking is key here. Why are you asking this question--what gap in knowledge is there, and why should I care about this topic? Is the experiment really testing what you want it to? How would we interpret your results?

The presentation should have:
- A brief background setting the stage for what we know and don’t (1-2 slides)
- The question and clearly stated hypothesis (1 slide)
- The experiment and how the results will address the issue (1-2 slides)
- Alternative outcomes / potential problems (1-2 slides).

You will be graded on 1) clarity of the background information/topic to be studied, 2) clarity of, and importance of the question to be addressed 3) efficacy of your experiment in providing an answer to that question, 4) presentation style and ability to answer questions, 5) respecting the time limit.

Policy on Academic Dishonesty: The UCI policy on academic dishonesty is stated at: http://www.editor.uci.edu/catalogue/appx/appx.2.htm#academic. Lying to an instructor with the intent of improving a grade, or use of a restricted electronic device during an exam are considered forms of academic dishonesty. Any student aware of academic dishonesty is encouraged to bring this to the attention of the instructor; your confidentiality is guaranteed.

Readings: It is your responsibility to read the assigned articles before class. This is a discussion-based class and having read the materials ahead of time is essential. Note: Readings and schedule subject to change at the instructors’ discretion.
